

Implementation of Sub-Metering

Business Focus

A Large Manufacturing company with multiple operations in a variety of buildings on the same site wanted to access live data for their energy consumption as well as pay greater attention to the performance of their production lines.

Sustainable Action taken – implementation of Sub-Metering

Sub metering allows a business to pro actively monitor and make changes to their building and equipment performance and operation in order to save energy, carbon and of course EXPENDITURE.

Sub Metering means that a company can view LIVE consumption data rather than wait until the day that invoices are received which would speed up the decision making process. It also means that key areas of a building can be monitored and compared to more efficient areas of the site. Sub Metering also allows a business to monitor day/night consumption identifying 'waste' consumption or consumption that could be moved to a more cost effective part of the 24 hour day.

Business, Finance and Operational decisions can all be made with the introduction of Sub Metering as actual data can always be referred to.

How can members action this?

BFFF's Energy Purchasing Scheme is in association with Blue Castle Energy. Blue Castle Energy can support members to implement Sub Meters within their operation and in addition, Blue Castle's software supports Sub Metering data as an added management tool.
